The AutoCAD BOM Script is an open source tool for automating the creation of Business Object Model (BOM) for AutoCAD with version history and version tracking of the BOM objects. You can easily create a new BOM in the following very simple way: If you have Autodesk AutoCAD 2017, this link will take you to the BOM Script documentation. The AutoCAD BOM Script documentation is available in English, French and German. The author is Pierre Villeneuve. Introduction The goal of the AutoCAD BOM Script is to help the user create a Business Object Model for his/her project. Here is an example of a Business Object Model that can be created with the AutoCAD BOM Script. Each element of the Business Object Model (BOM) is associated with a Business Object that can be used for various purposes, such as: Automatically create a Business Object for each element of a BOM. Search a Business Object by its name. Add some Business Objects to a file. ...and so on. A Business Object can be in one of three states: Created - the Business Object is in this state at the start. Deleted - the Business Object has been deleted. On hold - the Business Object is in this state until it is created or deleted. Other objects in the model have a relationship with a Business Object, whether they are a child of the Business Object or a relationship in a relationship. It is possible to export the Business Object to other CAD software (on the same computer or on other computers). Here are the five types of Business Objects: Business Objects with a name and description, used for representing a Business Object in the Business Object Model. A Business Object can have its name automatically created by the AutoCAD BOM Script. Registered Business Objects that have been created in the current session. Business Objects that have been added to a model. Business Objects that have been deleted. Business Objects that have been on hold. Business Objects with a name and description A Business Object with a name and description can be a node of the Business Object Model. When an element is created, a Business Object with a name and description is automatically created for it
